

NATIONAL HURRICANE CENTER FINAL ADVISORY:

DANNY DEGENERATES INTO A TROUGH OF LOW PRESSURE

Reports from an Air Force Hurricane Hunter plane indicate that Danny has degenerated into a trough of low pressure, according to the National Hurricane Center.

At 11 a.m., the remnants of Danny were located near Latitude 16.0 degrees North, Longitude 62.0 degrees West. The remnants are moving toward the west near 12 miles per hour, and this general motion is expected to continue for the next day or two. Maximum sustained winds have decreased near 30 miles per hour with higher gusts. The trough is expected to dissipate during the next couple of days.

The National Hurricane Center is forecasting that the remnants of Danny are expected to produce 2 to 4 inches of rain over the Leeward Islands, the U.S. and British Virgin Islands, Puerto Rico, and the Dominican Republic through Tuesday night.

There are no coastal watches or warnings in effect.

This is the last public advisory issued by the National Hurricane Center on Danny. Additional informational on the system will be provided by the National Weather Service Forecast Office at San Juan.
